

Actium ERP

For small and medium sized manufacturers

ActiumERP is an accounting and manufacturing solution for small and medium sized companies. Designed on the world's most powerful open source database, ActiumERP provides flexibility and scalability for growth.

Easy to Implement and adapt.

ActiumERP is based on a multitier architecture where the data tier is running on one of the most advanced open source databases. ActiumERP provides end to end business management tools for small to medium sized companies. Server environments can be open source or proprietary based and can be hosted or in-house. Work stations are windows based or hosted desktops.

Grows with your business.

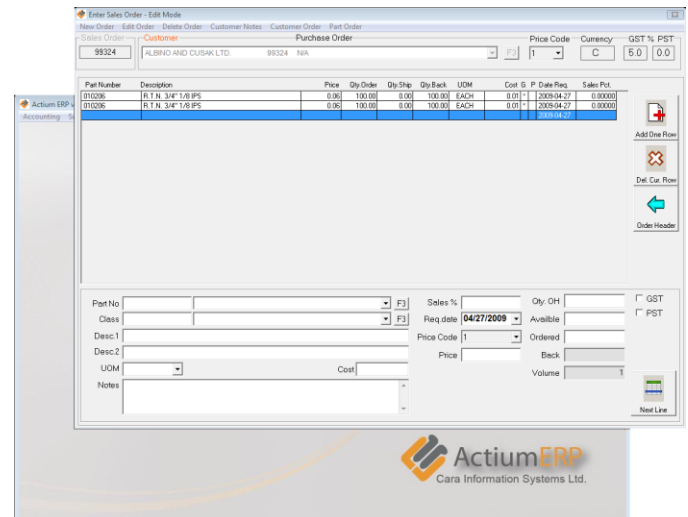

ActiumERP provides flexibility to scale to your business needs. It works as a single user application, larger corporate environments, remote user or remote offices. The flexibility is build into the application. The database backend allows you to connect 3rd party applications or develop custom applications that are integrated. The database backend allows for redundancy and allows growth by adding users. There is no need to upgrade or purchase a different version.

Global Business Design.

Today's businesses must be able to operate from multiple locations. ActiumERP supports multiple currencies and allows for use of various taxes to meet the local requirements.

Ease of use and customization.

ActiumERP can be customized to integrate with other applications. In-house staff can developed custom features or third party development can be done to access data and integrate into other applications.

Secure Access.

Secure data is extremely important in today's business environment. Access to data and applications can be controlled as much or as little as required. The User administration interface can fine tune access to all applications and/or reports. The database access controls can allow or restrict access to devices, groups of devices or networks, restricting unauthorized attempts to access the data.

Integrated Applications.

All modules are completely integrated and connect to the General Ledger. Use as many or as few modules as required. The software installs with all applications enabled and there is no need to upgrade to get more functions.

ActiumERP Modules

- General Ledger System
- Accounts Receivable System
- Accounts Payable System
- Bill of Material System
- General Ledger System
- Order Entry System
- Inventory Control System
- Job Costing/Work Orders System
- Material Requirements System
- Payroll (Canadian) System
- Purchase Order System
- Rental System
- Sales Statistics System

Database Backend.

The data storage is done on Postgresql (<http://www.postgresql.org>), one of the most powerful open source databases. By design, it is an ideal data storage backend for a demanding business application. Its SQL

implementation strongly conforms to the ANSI-SQL:2008 standard. It includes data integrity features and a host of extensions and advanced features. It is able to be run on Linux and Microsoft Windows servers or smaller installation can use Microsoft Professional XP or newer workstations.

Investment Protection.

The open source database can be installed and distributed for free and is free to use for anybody. This greatly reduces the cost of user licensing and cost of the database. Maintenance agreements for ActiumERP are available based on user count. Maintenance agreements do not just include updates but also upgrades. This means that users with a maintenance agreement will always enjoy the latest version of the software without having to purchase an upgrade. Systems are expanded by purchasing additional user licenses.

About Cara Information Systems Ltd.

Cara is a privately owned software development company that has been developing Business applications and applications for the healthcare industry for over 30 years. Cara is also engaged in a number of custom software development projects for vertical markets. As part of our business, Cara provides network and server administration to provide the customer a turnkey solution and one stop shop for a companies IT requirements. This reduces finger pointing between application providers and network administration staff.
